

For each chart below, answer: What is it trying to tell you? Do you trust it? Why or why not?

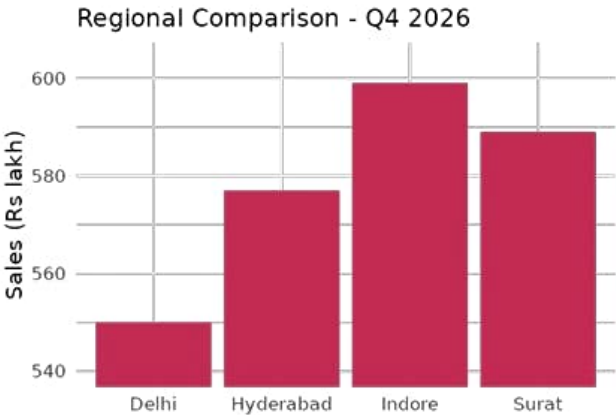

Chart 1

Survey Responses by Option (13 categories)

Chart 2

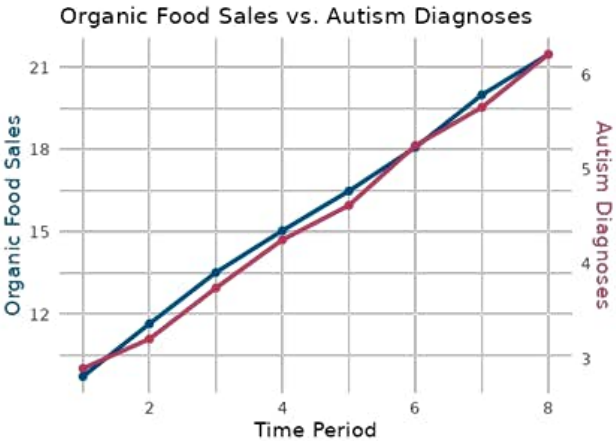

Chart 3

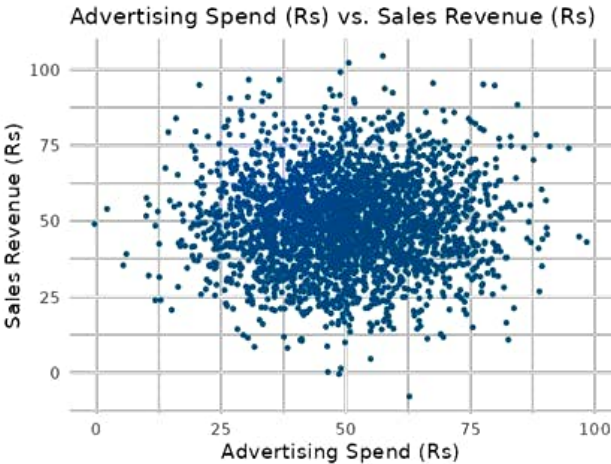

Chart 4

11/01/2026

Session - I

Roll No: 25

Activity

N. Lahari

### Chart-1: Regional Comparison - Q4 2026

⇒ This chart shows about Regional Comparison - Q4 2026 and it has ~~been~~ compared between 4 different places, i.e. Delhi, Hyderabad, Indore & Surat. In this graph it mainly compares the sales (Rs lakh). It is trying to tell sales are highest in Indore, followed by Surat, Hyderabad & Delhi. I will trust <sup>partially</sup> ~~it~~ because the bars show the values clearly, and the source is not given in chart.

### Chart-2: Survey Responses by option (13 categories)

⇒ This chart shows how survey responses are divided among 13 options. I will not trust it fully because the chart has no option names, values or source. So that I cannot know that which colour represents which category. So, I don't trust this chart fully.

### Chart-3: Organic Food Sales vs. Autism Diagnoses.

⇒ This chart shows the <sup>comparison</sup> ~~difference~~ between organic food and Autism Diagnoses. It shows that organic food sales and Autism Diagnoses sales are increasing at the same time & range. And ~~a~~ both are in y-axis both are increasing over time. I don't trust this because both sales are increasing overtime and both are in y-axis and I don't think that one causes another. In this chart I have seen that both ~~are~~ sales are growing same time. So, I don't trust.

#### Chart 4: Advertising Spend (Rs) vs. Sales Revenue (Rs)

⇒ This chart shows the Comparison between Advertising Spend and sales Revenue. In chart Sales Revenue is in y-axis and Advertising Spend is in x-axis. I trust this chart partially, because there are many data points and there is no ~~exaa~~ exact points and the chart is not providing the sample size or values. So, I ~~don't~~ partly trust this chart.
